# The Right Geology

Crown claims are underlain by the same aged geological units that host the majority of the deposits in the Golden Triangle; Stuhini and Hazelton group with various intrusions.

The Sulphurets thrust fault, a major regional structure associated with Seabridge Gold and Tudor Gold's large copper-gold porphyry deposits, extends through Crown.

The central portion of Crown has been largely unexplored. Potential for porphyries associated with large scale faulting below the surface, such as at Tudor Gold's porphyry system, the Goldstorm Deposit.

Hazelton group volcanoclastics, Texas suite plutonic rocks and high-grade gold-silver epithermal veins at Electrum (lower Crown claims) parallel the geology of the Brucejack mine.

## TARGETS

- ❖ High-grade precious and base metal systems
- ❖ Porphyry and intrusive-related targets

## HISTORIC RESULTS

### ❖ 1987-88 Surface sampling:

- Chip samples across a 30 m by 13 m stockwork zone assayed **25.94 g/t gold**

### ❖ 2016 Geophysics:

- A magnetotelluric (MT) survey over Orion identified areas of low resistivity which coincide with Stuhini Group rocks and high resistivity areas with Hazelton Group rocks
- Sharp changes in resistivity profiles indicate a major fault, agreeing with the interpretation of the continuation of the extension of the regional Sulphurets thrust fault
